

What exactly is "Diesel Bug"?

Gas oil or Derv is delivered to your tank.

The combination of water and oil can cause bacteria to multiply within the tank.

Due to temperature differences between oil and atmosphere, condensation can build up on walls of the tank and run down to the bottom creating a layer of water in the tank.

The "bug" grows in a thick, slimy brown/black layer between the oil & Water

This leads to blocked fuel filters & corrosion to fuel lines leading to expensive repair bills

Anti-bug Kill additives will eradicate the problem and Anti-bug Protect can be added during future deliveries to prevent a re-occurrence
